

DAY-2 JENKINS –GITHUB-DOCKER INSTALLATION SETUP

Step 1: Install Docker

- The document likely includes steps for **downloading and installing Docker** on a system (Linux, Windows, or Mac).

Step 2: Enable and Start Docker

- After installation, Docker needs to be **enabled and started** to run properly.
- Common commands for Linux:

sudo systemctl enable docker

sudo systemctl start docker

Step 3: Verify Installation

- After starting Docker, it's important to **check if the installation is successful**

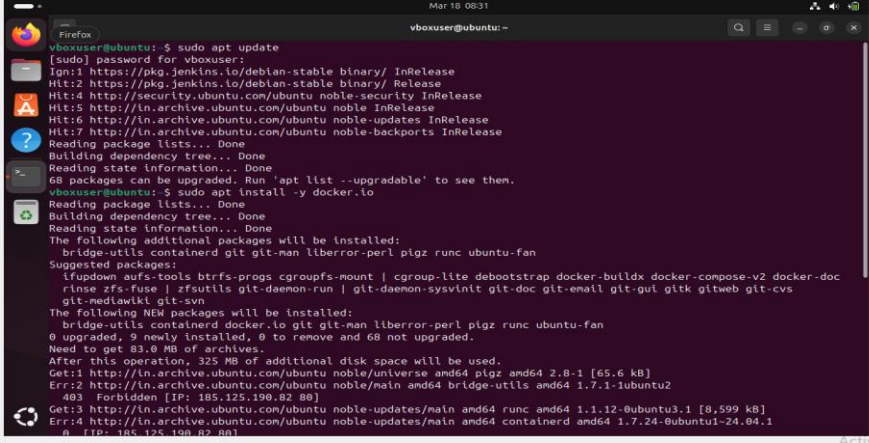

Step 4: Additional Setup (GitHub Token Link)

- The document contains a **GitHub token generation link**:
[GitHub Token Settings](#)
- This suggests that authentication with GitHub (e.g., for Docker Hub access or private repositories) might be required.

Step 5: Test Docker

- Run a test to ensure Docker is functioning correctly.
- If the test is successful, Docker will display a message confirming that it is installed and working properly.

Step 1: Install Docker

```

```

Help Exit Write Out Read File Where Is Replace Cut Paste Execute Justify Location Go To Line Undo Redo Set Mark Copy

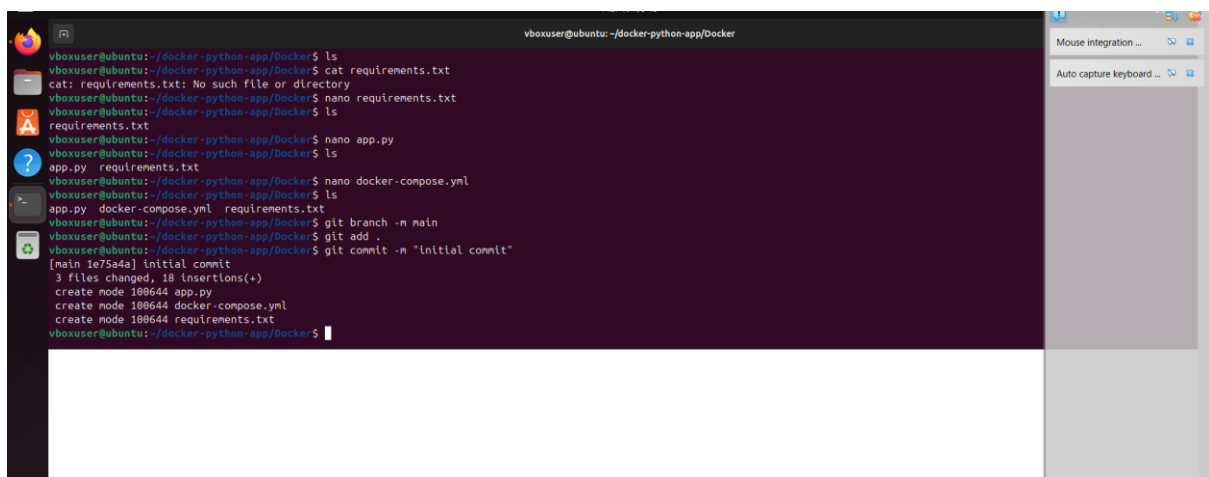

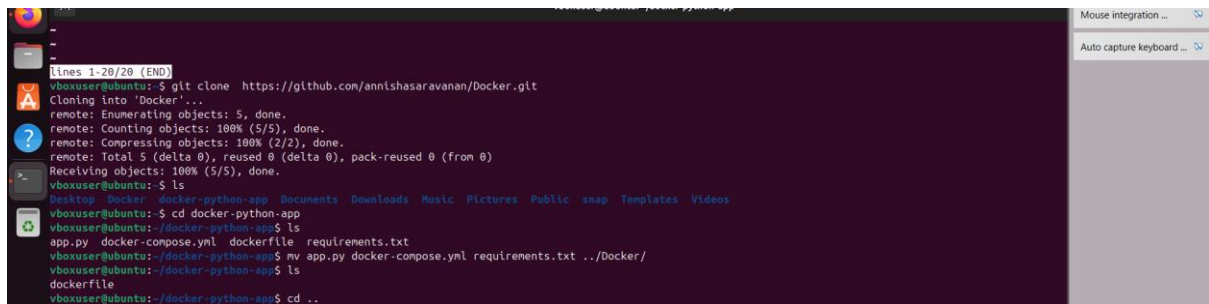

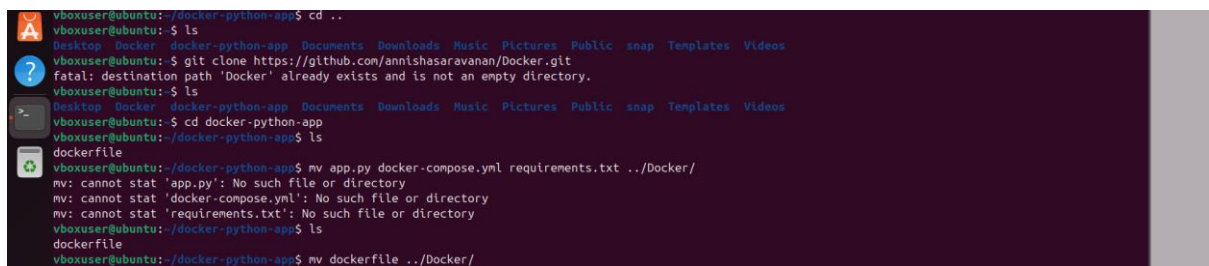

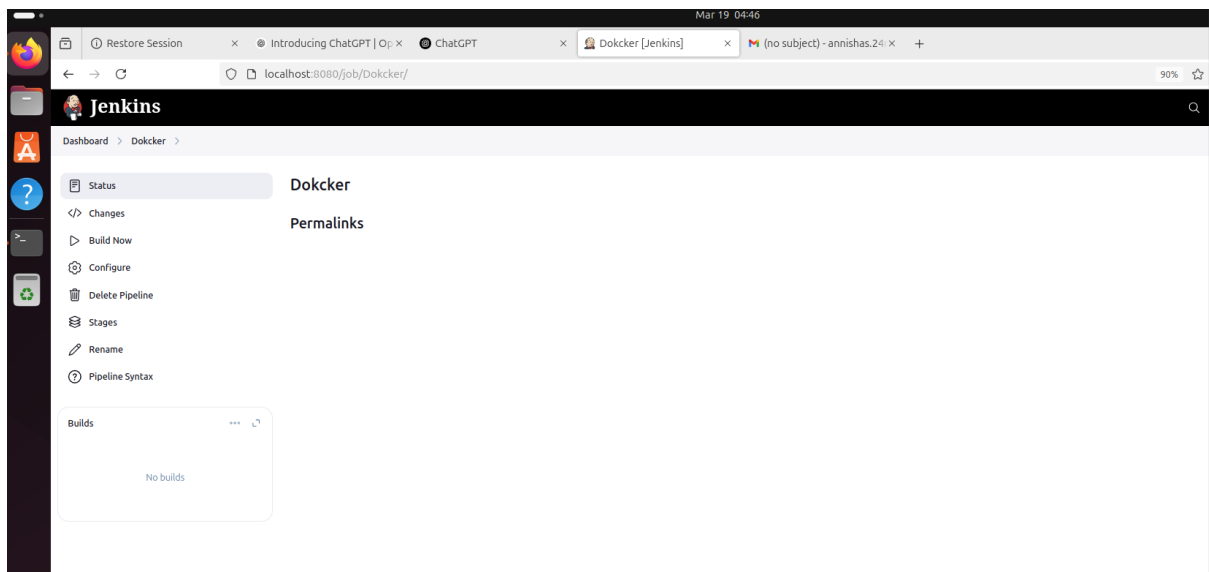

```
vboxuser@ubuntu: /docker-python-app$ sudo docker-compose up --build
bash[0000] /home/vboxuser/docker-python-app/docker-compose.yml: the attribute 'version' is obsolete, it will be ignored, please remove it to avoid potential confusion
Compose can now delegate builds to bake for better performance.
To do so, set COMPOSE_BAKE=true.
